

CDE POLY MODULAR PANELS

CDE panels are one of the most versatile and cost effective modular systems available.

They can be used in many applications such as: Sand and gravel, granite, silica sand, limestone and coal.

CDE panels consist of steel reinforcement bars parallel to the panel width and moulded in polyurethane or rubber. When fitting the panels they are parallel to the flow of the materials, it is common to stagger each row to prevent build-up of fines along joins of screens.

When staggering the panels isn't possible, then the flow of material can be diverted by deflectors that are moulded onto the sides of panels.
